

Purpose

This document describes how to manually install Nagios Network Analyzer from source on a clean system. These directions assume that you are using a current version of a RHEL/CentOS compatible system. Nagios Network Analyzer is supported only on the following Linux distributions:

- RHEL 6 32-bit and 64-bit, RHEL 7
- CentOS 6 32-bit and 64-bit, CentOS 7

Target Audience

This document is written for administrators who are looking to perform a new installation of Nagios Network Analyzer from source, rather than using a pre-configured virtual machine image.

Installation Prerequisites

Important: Nagios Enterprises highly recommends and will only support installing Nagios Network Analyzer on a newly installed, "clean" system (a bare minimal install with nothing else installed or configured).

Attempting to install Nagios Network Analyzer on a pre-existing system with other applications already installed can cause the Nagios Network Analyzer installation process to fail, critical system components and settings (e.g. database servers) to be modified in a way that negatively affects other applications, and previously installed applications to be automatically upgraded or removed. While installing Network Analyzer on a system with other applications is possible, it is not recommended due to the possible interactions and complexity of multiple components that are required for Nagios Network Analyzer to function. If you choose to ignore these warnings, you do so at your own risk.

Internet access is required for installation and upgrades!

Terminal Access

These instructions require you to establish a terminal session to the server you plan to install Nagios Network Analyzer on. You will need to login to your server as the root user to perform the installation.

Install Nagios Network Analyzer

There are two methods for installing Nagios Network Analyzer, they both perform a full installation.

Quick

Execute the following command in your terminal session:

```
curl https://assets.nagios.com/downloads/nagios-network-analyzer/install.sh | sh
```

That one command will download and install Nagios Network Analyzer. Please proceed to the [Finalize Installation](#) section.

Manual Download

Alternatively, you can install Nagios Network Analyzer by issuing the following commands in your terminal session:

```
cd /tmp
wget https://assets.nagios.com/downloads/nagios-network-analyzer/nagiosna-latest.tar.gz
tar xzf nagiosna-latest.tar.gz
cd nagiosna
./fullinstall
```

Note: If you need to install a specific version of Nagios Network Analyzer, please visit the following page of Nagios Network Analyzer versions to obtain the URL, use that in the `wget` command above:

<https://assets.nagios.com/downloads/nagios-network-analyzer/versions.php>

Please proceed to the [Finalize Installation](#) section.

Finalize Installation

The installation will be complete when you see this message:

```
Nagios Network Analyzer Installation Success!
```

```
You can finish the final setup steps for Nagios Network Analyzer by visiting:
http://<server_ip_address>/nagiosna/
```

Navigate to the user interface by using the URL provided in your terminal session.

When you open the URL provided on the console in your web browser, you will be shown the Installation page.

Here you will set your Administrator account Username, Password and email address. You also are able to add your license key if you already purchased your license.

Click **Finish Installation** to save these settings.
